

## Summary Document

My website meets the specifications in multiple ways. I have implemented 2 jQuery plugins and 1 jQuery-UI widget across my website. My first jQuery plugin can be found through the use of the bxSlider plugin for my photo gallery that can be found on my *index/home* page. The second plugin can be seen on the *portfolio* page where I used a plugin called “Lightbox” that magnifies each image when a user clicks on them. The jQuery-UI widget can be found on the *services* page utilizes the Accordion widget to display a list of services that my client provides in an orderly fashion. I have also implemented 2 AJAX requests that are retrieved from JSON files. The first request can be found in my *index/home* page where the list of services displayed is from a JSON source. This allowed me to properly list the services efficiently. The second request can be found in the footer of every page, I retrieved the contact information from a JSON file to efficiently display this info. Additionally, I implemented at least 5 accessibility guidelines across all pages. I utilized the “aria-label” to label objects that are not associated with any text that is displayed. I used “alt” attributes on all of my image elements to provide additional accessibility. I displayed the “aria-alert dialog” on the *contact* page to identify any errors that may occur through the user input. I also utilized a ‘submit” button on the contact page to properly allow the user input to refresh and allow additional input to be possible. The last accessibility guideline I followed was the use of color and pattern which is exceptionally important when dealing with a consistent website.

On my first peer review from Jake Treese, he made a lot of helpful suggestions which I did indeed implement. The main thing that he stated was that the contrast of colors did not accent well with the yellow background choice. I originally had a grey header and footer that paired with the yellow body but the background of the HTML page was white. I changed the background of the HTML page to a light blue which ended up contrasting the yellow perfectly. I utilized light colors throughout the course of my webpage so I wanted to continue with that particular theme. Another thing that Jake stated was the fact that I did not have any validation links in the footer of my pages which I also implemented. The rest of his suggestions consisted of minor formatting issues which I have now changed.

My second peer review was conducted by Justin Leiner. He had also given me feedback that was helpful. Although his suggestions did mirror some of the ones that Jake had stated, there were a few that caught my attention. Justin identified that I did not have a tagline that was displayed on each page. I had completely glanced over this when creating my webpage so I have thus implemented that feature. The rest of his suggestions focused on various formatting changes like alignment and proximity.

I believe that the website I created shows great promise. My client, Neal Patel, essentially wanted something that was marketable of his portfolio and demonstrated his key audience as well as the content he produces. I made sure to implement the additions that he wanted to specify. Although I do believe that his website is sufficient in terms of a starting point, I would love to continue working on it as time goes on. I would like to create a contact page that is operable in terms of logging user information. I would like to make the design of the web page

a little more professional to make it more approachable. The future of this website lies in its effectiveness to reach clients. I would like to try and advertise Neal's endeavors and hopefully use this project to create leverage for his clients.
